

ABSTRACT OF THE DISCLOSURE

This subject invention enables the cutting of a whole raw potato by the operator into a fixed thickness continuous spiral slice for cooking as deep frying a potato chip. A fixed pilot pin and a threaded spindle with driver attached support the potato in position in front of the single angled blade. Precise thickness of the slice is achieved by the turning of the 3/8 – 16 threaded spindle by means of an attached handle. The requirement of two hand operation is an intentional safety factor in the design. It prevents the hands from being in a position to contact the sharp blade and/or sharp driver during operation of the invention.
